

KEY TAKEAWAYS — Incident Management & Downtime Analysis

1,500 incidents | 2024–2025

Findings

1. **Breaches are everywhere, but risk is concentrated.** All Tier 1 operations breached their limits, yet most downtime traces back to three services: Card Payments Gateway, Mobile Banking, and BPAY.
2. **Gold-tier vendors aren't worth their tier.** The three costliest vendors all hold Gold SLAs, while Bronze and Silver vendors score better on risk.
3. **The process works; weekend coverage doesn't.** Routine response times are healthy across the board. The only breakdown is weekend off-peak, where worst-case delays run 4x higher — a staffing and handover gap, not a workflow one.
4. **Data quality is undermining the numbers.** Roughly one in seven records can't be trusted for reporting, and one vendor's logging errors suggest tickets are being closed early to protect SLA metrics.
5. **Actual exposure is likely larger than reported.** Excluded outliers carry an estimated loss nearly 3x the headline figure, and several incidents show customer impact with no recorded downtime — silent outages in internal systems.

Recommendations

1. Prioritise resilience upgrades for Card Payments Gateway and BPAY; address Mobile Banking through transaction handling instead.
2. Audit underperforming Gold vendors and enforce penalty clauses; formalise the contract with the best-performing vendor and revisit tier pricing.
3. Review weekend on-call staffing and ticket handover; add an auto-alert for tickets exceeding 40 minutes.
4. Mandate logging quality improvements and automated validation rules to stop unreliable records entering the dataset.
5. Run root cause analysis on excluded outliers and unclassified incidents to confirm true exposure.
